Syndeo PCA Syringe Pump
User's Guide
Warning

There are risks associated with using anything other than the recommended syringes and sets with this pump. Syringes and sets designated for use with this pump are identified in "Packing Up the Pump." Baxter's warranty on the pump will be null and void and Baxter will assume no responsibility for incidents that may occur if the product is not used in accordance with product labeling. Refer to "Introduction" for a list of warnings and cautions, as well as the applicable warnings and cautions that appear throughout the user's guide.

Disclaimer

The information in this document has been carefully examined and is believed to be entirely reliable. However, no responsibility is assumed for inaccuracies. Furthermore, Baxter reserves the right to make changes to any product herein to improve reliability, function, or design. Baxter does not assume any liability arising out of the application or use of any product or process described herein, nor does it extend any license under its patent rights for the right of others.

Year 2000 Compliance

This product is Year 2000 Compliant and will function as designed through 1997 without interruption or failure by the occurrence of dates prior to, during, or after Year 2000.

Documentation Copyrights

Duplication or distribution of this manual and any information contained within is strictly prohibited without the express written permission of Baxter. The manual and any information contained within may not be reproduced, distributed, or translated in any form or by any means, for any purpose, without the express written permission of Baxter. To order additional copies of this manual, or other related manuals, contact your local Baxter Healthcare Corporation representative.

Patent Information

This pump is protected under one or more of the following U.S. and foreign patents: U.S. Patents 5,518,627, 5,543,678, 5,563,792, 5,735,918, 6,105,947, 6,309,252, 6,620,530, 6,676,904, 6,873,225, 6,914,351, 7,065,559, 7,119,285, 7,146,887, 7,171,875, 7,183,760, 7,196,796, 7,202,892, 7,210,218, 7,234,818, 7,257,709, 7,309,464, and corresponding foreign patents. For more information, refer to the pump's patent list (located under the Security panel).

Trademark Information

Introduction

This user's guide provides the operating instructions for the Sydnea PCA Syringe Pump (product code 2L3113). It is a syringe-based pain management infusion pump.

The Sydnea PCA Syringe Pump is designed for the controlled delivery (continuous, intermittent, and continuous plus intermittent) of analgesic, sedative, and anesthetic solutions through clinically acceptable routes of administration, including intravenous, subcutaneous, spinal, epidural, and for regional anesthesia applications.

The Sydnea PCA Syringe Pump is appropriate for use in hospital or alternate medical site environments, but it is not intended for use in homecare settings.

The Sydnea PCA Syringe Pump is not indicated for use with blood or blood products.

The Sydnea PCA Syringe Pump is made in the USA or Singapore.

Safety Summary

Prior to operating this pump, the user should carefully read this manual to fully understand the functionality and to ensure safe and proper operation.

Only use this pump under the direction of trained medical professionals who are thoroughly familiar with this manual, including warnings, cautions, and instructions for use.

This manual is intended for clinicians only. DO NOT permit patients to have access to this manual. DO NOT disclose the pump's security code to patients.

Although this pump has been designed and manufactured to exacting specifications, it is not intended to replace trained personnel in the supervision of infusions.
Definitions

Attention; consult accompanying documents.

**WARNING**

Indicates a possible hazard which, if ignored, could result in severe personal injury or death.

**NOTICE**

Indicates a potential problem or unsafe practice which, if not avoided, could result in minor to moderate personal injury or product or property damage.

**Note:**

Provides supplemental information to the accompanying text.

Warnings

**Note:** Additional warnings appear throughout this user's guide, where appropriate.

**WARNING**

To ensure safe and proper operation, read the manual and any instructions accompanying disposables or accessories before operating the pump.

**NOTICE**

This pump should only be used with Baxter accessories specified in the "Setting Up the Pump" chapter of this manual. There are risks associated with using anything other than the recommended accessories with this pump.

**WARNING**

Nasal and venous protocols for the prescription and delivery of narcotic analgesic drugs, including the administration, monitoring, and care of patients receiving nasal drug, should be followed when dispensing narcotic analgesic drugs to patients using this device.
As with all medical electronic equipment, care must be exercised to avoid exposing this pump to powerful sources of electromagnetic interference. Using the pump near operating equipment which radiate high-energy radio frequencies (such as electrosurgical/cauterizing equipment, two-way radios, or cellular telephones) may cause false alarm conditions. If this happens, reposition the pump away from the source of interference.

Patients receiving parenteral analgesic drugs with any patient-controlled analgesia (PCA) pump should be instructed in the proper use of the device. Instructions should include that only the patient or a licensed healthcare practitioner may operate the PCA button, unless the prescribing physician authorizes a lay caregiver to do so. Without physician authorization, operation of the device by all other persons is prohibited.

Be sure to purge all air from syringe and infusion lines before administering any medication. Failure to follow this infusion procedure could precipitate serious injury and/or death.

If the pump has been dropped or appears to be damaged, it should be taken out of service and inspected by qualified service personnel only.

When disposing of this pump, batteries, or the syringes and administration sets designed for use with this pump, adhere to local regulations and guidelines.

To help prevent medication errors, Baxter recommends that both the clinician programming the pump and another clinician check the accuracy of prescription and programming information before the infusion is started.

This pump has not been evaluated for use within magnetic resonance imaging (MRI) or electrosurgical unit (ESU) environments, or with other medical equipment that emits radiation for diagnostic or therapeutic purposes.

This pump is not intended for use on the inlet side of extracorporeal membrane oxygenation (ECMO) systems where high negative pressures can occur.
Epidual administration of drugs other than those indicated for epidural use could result in serious injury to the patient.

- Epidural administration of anesthetics is limited to short-term infusion (not to exceed 96 hours) with indwelling catheters specifically indicated for short-term anesthetic epidural drug delivery.

- Epidural administration of narcotics is limited to use with indwelling catheters specifically indicated for either short-term or long-term analgesic epidural drug delivery.

- To help prevent infusion of drugs not indicated for epidural use, do not use administration sets incorporating injection sites during epidural delivery.

- Clearly distinguish pumps used for epidural drug delivery from pumps used for other routes of administration.

**WARNING**

Narcotics and drugs approved for epidural administration should be administered by or under the direction of a physician experienced in the technique of epidural administration and who is thoroughly familiar with the drug labeling. It should be administered only in settings where adequate patient monitoring is possible. Reversal equipment and a specific antagonist (Naloxone injection) should be immediately available for the management of respiratory depression as well as complications which might result from inadvertent intravascular or intrathecal injection. Patient monitoring should be continued for at least 24 hours after each dose, since delayed respiratory depression may occur.

Proper placement of a needle or catheter in the epidural space should be verified before drug infusion is started.
WARNING: Narcolepsy and drugs approved for intrathecal administration should be administered by or under the direction of a physician experienced in the technique of intrathecal administration and who is thoroughly familiar with the drug labeling. It should be administered only in settings where adequate patient monitoring is possible. Resuscitative equipment and a specific antagonist (Naloxone injection) should be immediately available for the management of respiratory depression as well as complications which might result from inadvertent intravascular injection. Patient monitoring should be continued for at least 24 hours after each dose, since delayed respiratory depression may occur. Respiratory depression (both early and late onset) has occurred more frequently following intrathecal administration than epidural administration.

Cautions

Note: Additional cautions appear throughout this user's guide, where appropriate.

CAUTION: In the U.S., use of this pump is restricted by federal law (USA) to sale or use by, on the order of, or under the supervision of a physician or other licensed health care professional.

CAUTION: This pump is electronic medical equipment and should be handled with care.

CAUTION: Use only accessory equipment complying with the pump's safety requirements. Failure to do so may lead to reduced safety levels of the resulting system. Consideration relating to accessory choice shall also include:

- Use of the accessory in the patient vicinity.
- Evidence the safety certification of the accessory has been performed in accordance with the appropriate UL 2601-1 and/or IEC 60601-1 harmonized national standard.

CAUTION: To reduce the risk of electric shock, do not remove the pump's housing. Refer servicing to authorized service personnel.

CAUTION: NEVER use the pump and pole as a patient support.
Do not use hard or sharp objects on the keypad display screen.

Do not operate this infusion pump in the presence of flammable anesthetics, ether, oxygen-enriched, or explosive atmospheres.

Do not expose the pump to X-rays, gamma rays, or other ionizing radiation, or to strong electric or magnetic fields.

This pump may interact with some ECG monitoring equipment during infusions. Proper set up of the ECG monitor should eliminate any difficulties. Consult the ECG monitor instruction manual for more information.

The operator should verify that the pump's settings are appropriate for the clinical application.

Wipe off spills immediately. Do not allow fluid or residue to remain on the pump.

Follow the cleaning schedule and methods as defined in the "Routine Maintenance" chapter of the Synolect PCA Syringe Pump Technical Specifications to ensure proper maintenance of the pump.

Routine checks and maintenance procedures, as well as periodic calibration verifications, must be performed so that patients receiving infusions can be assured of accurate trouble-free operation.

Refer all service, repair, and calibration to authorized technical personnel.
Pump Overview

Figure 1
Buttons

START, STOP, PREFERENCES, HISTORY, and MUTE are located on the front panel. ON/OFF is located inside and at the bottom of the syringe compartment.

Note: Button names appear in all capital letters in this manual (for example, "press the START button" or "press START").

ON/OFF
- Press to turn on the pump.
- Press and hold for approximately two seconds to turn off the pump.

START
- Starts or restarts a prime, an infusion, a loading dose, or a clinician dose.

STOP
- Stops a prime, an infusion, a PCA dose, a loading dose, or a clinician dose.

Note: The pump will stop if the battery pack is removed.

PREFERENCES
- Views or changes the pump options, such as screen brightness, alarm volume, etc.

HISTORY
- Views the detailed patient infusion history.

MUTE
- Temporarily silences the alarm and alert tones.
Front Panel Lights

**INFUSION** (green)
- This light flashes when the pump is running an infusion.
- It is off when the infusion has stopped.
- It is off when the pump is in an alarm or service code.
- It is on during power on self tests (POSTs) and power on self test failures.

**ALERT** (yellow)
- This light flashes slowly when the pump is on but not running an infusion.
- It flashes quickly during an alert.
- It is on during power on self tests and power on self test failures.

**ALARM** (red)
- This light flashes during an alarm.
- It is off during service codes.
- It is on during power on self tests and power on self test failures.
Display Screen

To conserve battery life, the display screen "sleeps" or goes blank after one minute without user interaction. (The longer the display screen stays on and the brighter the display screen setting, the quicker the battery power will deplete.) To "wake up," simply touch the display screen.

Note: Screen titles appear in quotation marks in this manual (for example, touching the screen will advance the pump to "Load Syringe.")

Keys

Note: Key names appear in all capital letters in this manual (for example, "press the ENTER key" or "press ENTER")

Keys are located on the display screen, and are used to move up and down through lists, as well as start or stop a process. A key press is accepted after the release of the key.

- **ENTER**
  - Select an item, then moves to the next associated screen.

- **UP**
  - Moves the highlight bar to the next position.

- **DOWN**
  - Moves the highlight bar to the next position.

- **PAGE UP**
  - Moves backward through long lists of items.

- **PAGE DOWN**
  - Moves forward through long lists of items.
CLEAR or CLEAR RX
- Clears data or prescription information.

YES
- Provides an affirmative answer to a screen prompt.

NO
- Provides a negative answer to a screen prompt.

BACK
- Takes the user to the preceding screen.

CANCEL
- Cancels choices and displays the previous screen.

OKAY
- Takes the user to the next screen.

CONFIRM RX OKAY
- Confirms the prescription and takes the user to the next screen.

PLUS
- Increases values, such as screen brightness or tone volume.

MINUS
- Decreases values, such as screen brightness or tone volume.
CLINICIAN BOLUS
- Takes the user to the "Enter Clinician Bolus" screen.

STANDBY
- Retains the programmed prescription in the pump's memory for future use.

WAKE
- "Wakes up" the pump after the STANDBY key has been pressed.

EDIT RX
- Takes the user to the screen that will show prescription information editing.

OPTIONS
- Accesses the "UPLOAD" and "PRINT" keys.

UPLOAD
- Transfers the pump information to an optional PCA.

PRINT
- Transfers the pump information to an optional printer.
Battery Icon

The battery icon indicates the *approximate* charge state, which may vary depending on how the pump is used.

- Three bars displayed indicate approximately 80% or more capacity.
- Two bars displayed indicate more than 50% but less than 80% capacity.
- One bar displayed indicates more than 20% but less than 50% capacity.
- A white flashing battery indicates less than 20% capacity and that the batteries should be changed immediately.
Numeric Keypad

Press the numeric and decimal point keys to input data.

Audible Feedback

Note: When the user presses an "open area" of the display screen, no tone will sound.

- **Alert**: Produces a three-tone sound when an alert is active and has not been muted.

- **Alarm**: Produces a four-tone sound when an alarm is active and has not been muted.
  
  **Note**: The "Battery Depolarized" alarm tone cannot be muted.

- **Valid key press**: Produces a "high" tone when a valid button or key press is made.

- **Invalid key press**: Produces a "low" tone when an invalid button or key press is made.

- **Enabled close tone**: There is no tone difference between a valid or an invalid PCA button press.

- **Disabled close tone**: A three-tone sound is heard upon a valid PCA button press.
  
  A "low" tone is heard upon an invalid PCA button press.
Back of the Pump

Figure 2
Setting Up the Pump

Installing the D-Cell Alkaline Batteries

Note: When installing or replacing batteries, always insert four new batteries. Always use Duracell (MN1300) or Duracell ProCell (PC1300) D-cell alkaline batteries. The use of other alkaline battery brands may impact this product's battery life statements. Refer to "Specifications, Power" in the Technical Specifications for battery data coding information.

Note: After changing the batteries, the pump will allow the user to continue the previous infusion if it is restarted within one hour.

1. Refer to Figure 3. Press and hold the battery pack release button. Then, slide the battery pack out of the pump. You may want to use both hands (one to steady the pack) when removing the battery pack. Use care not to pinch your fingers or drop the battery pack.

Figure 3

2. To open the battery pack, turn the knob on the back of the battery pack (refer to Figure 4) counterclockwise. Remove the battery pack cover.
3. Remove the batteries by carefully turning the battery pack upside down over a suitable container.
4. Insert four D-cell alkaline batteries as indicated by the diagram in the battery pack base, or refer to Figure 4. Make sure that the batteries fully contact the terminals in the battery pack.

![CAUTION](Image)

To prevent electrical shock, use care when inserting the batteries. Batteries should not come into contact with metal or wet surfaces.

![CAUTION](Image)

For proper pump functionality, observe the correct polarity when installing the batteries.

5. Replace the battery pack cover.
6. Secure the battery pack cover in place by turning the knob clockwise.
7. Slide the battery pack into the pump until you hear a "click" into place.

Note: The pump will stop if the battery pack is removed.
Attaching the Pump to the Pole

**WARNING:** When attaching the pump to an IV pole, ensure that it has been securely clamped.

**WARNING:** To avoid personal injury, ensure that the IV pole is stable and secure. Ensure that the pole is able to support the pump, along with any other devices, without tipping or falling. Do not overload the pole. The pole diameter should be between 3/8" and 1 1/2" (0.95 cm and 3.81 cm).

**CAUTION:** Ensure that the pump is mounted where the syringe compartment is accessible and administration sets can be loaded without being stretched or kinked.

**CAUTION:** When attaching the pump to an IV pole, use care not to pinch your fingers while tightening the pole clamp.

**Note:** The pump should only be carried by the handle.

**Note:** Care should be taken to avoid impact with other objects.
1. Refer to Figure 5. Position the pole clamp around the pole.
2. Tighten the pole clamp knob until the pump is secured to the pole.
3. To lock the pole clamp, insert the key into the lock, then push in and rotate clockwise.
Attaching the PCA Button

1. Align the connector pins and socket. Then, insert the plug into the socket with the black button facing outward (refer to Figure 6).
2. To detach the PCA button, press and hold the black button on the side of the plug and pull it from the pump.

Figure 6
Turning On the Pump

The ON/OFF button is located inside the syringe compartment (refer to Figure 7).

1. Unlock the syringe compartment door by pressing in and turning the syringe compartment key counterclockwise. Then, open the syringe compartment door.
2. Press the ON/OFF button to turn on the pump.
Power On Self Tests (POSTs)

Note: To verify that the operator is authorized to use the pump, a key will be required during the power on test.

After the pump is turned on it goes through a series of self tests. These tests verify the proper operation of the pump. This is what you should see:
- The alarm (red), alert (yellow), and infusion (green) lights briefly turn on.
- The display screen turns white.
- The display screen turns black.
- The buzzer sounds.
- Three different tones sound from the speaker.

In the event of a POST failure, the red light will go on and a tone will sound. Turn the pump off and back on. If the error code or malfunction recurs, do not use the pump and contact authorized service personnel immediately.

Preparing the Tubing Set

WARNING: Do not connect the administration set to the patient when priming.

WARNING: Always read and follow the instructions that accompany the syringe and administration sets you are using. Carefully follow the instructions for attaching the set to the syringe. Set use should not exceed the label set change interval.

WARNING: Always close the clamp on the administration set before loading or removing the syringe.

WARNING: Before starting the infusion, visually verify that no air is in the set or syringe.

Note: Connections of this pump to the same patient line with other infusion systems or accessories may alter the system performance. Consult the infusion system or accessory manufacturer's instructions for use before proceeding. Outside the U.S.: Read document VDE0763-5 when performing parallel infusions.

Note: Call the Product Information Center (1-800-633-0303) if you have any questions regarding the appropriate sets to use with this pump.
Recommended Sets

It is a requirement of Baxter Healthcare Corporation that its syringe PCA pumps only be used with PCA sets that contain anti-siphon technology. The Baxter Anesthesia PCA sets containing integral anti-siphon technology are as follows:

<table>
<thead>
<tr>
<th>Brand Product Description</th>
<th>Product Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tamper Resistant Anti-Siphon PCA Extension Set, length 80&quot;</td>
<td>209205</td>
</tr>
<tr>
<td>Tamper Resistant Anti-Siphon PCA Extension Set, length 90&quot;</td>
<td>209206</td>
</tr>
<tr>
<td>Anti-Reflex PCA Y-Set, length 8&quot;</td>
<td>2L3506</td>
</tr>
<tr>
<td>Tamper Resistant Anti-Siphon PCA Combination Set, length 101&quot;</td>
<td>2L3507</td>
</tr>
<tr>
<td>Anti-Siphon PCA Extension Set, length 98&quot;</td>
<td>2L3508</td>
</tr>
<tr>
<td>Anti-Siphon PCA Combination Set, length 102&quot;</td>
<td>2L3509</td>
</tr>
<tr>
<td>Anti-Eliminating Eclipsor Extension Set (with 0.22 micron filter), length 89&quot;</td>
<td>2C9342</td>
</tr>
<tr>
<td>Eclipsor Extension Set, length 90&quot;</td>
<td>120042</td>
</tr>
</tbody>
</table>

Attaching the Set

Attach the set to the syringe following the instructions on the cabling set package.
Installing the Syringe

**WARNING**: Whenever a toxic or dangerous level of drug is stored in the syringe, constant monitoring of the infusion is required.

**WARNING**: Use caution when selecting the drugs intended to be delivered via the infusion pump. If the drug contained in the syringe will be exposed to extreme environmental conditions for prolonged time periods, it is important to select drugs that will not change pharmacologically upon such exposure.

**Note**: Syringes are intended for single use only. Dispose of used syringes properly.

**Note**: Call the Product Information Center (1-800-833-0303) if you have any questions regarding the appropriate syringes to use with this pump.

Recommended Syringes

**WARNING**: Use of other syringes and sizes may cause incorrect flow rates and dosages, and may cause damage to the pump.

**WARNING**: It is the user's responsibility to determine the syringe type. Otherwise, an unsafe condition may occur.

<table>
<thead>
<tr>
<th>Syringe</th>
<th>Volume</th>
</tr>
</thead>
<tbody>
<tr>
<td>MONOJECT</td>
<td>60 mL</td>
</tr>
<tr>
<td>B-D</td>
<td>60 mL</td>
</tr>
<tr>
<td>Baxter prefilled glass syringe (Morphine Sulphate, 1:1) Product code: 2L3000 (with needle guard)</td>
<td>50 mL</td>
</tr>
<tr>
<td>Baxter prefilled glass syringe (Mepiporine HCL, 10:1) Product code: 2L3000 (with needle guard)</td>
<td>50 mL</td>
</tr>
<tr>
<td>Baxter prefilled glass syringe (Morphine Sulfate, 5:1) Product code: 2L3003 (with needle guard)</td>
<td>50 mL</td>
</tr>
</tbody>
</table>
1. Unlock and open the syringe compartment door.
2. Turn on the pump.

**CAUTION** DO NOT load a syringe before the power up screen appears.

3. Refer to Figure 8. Fully squeeze the pusher block lever against the stop (refer to Figure 19). Then, slide the pusher block as far as possible to the top.

Figure 8
4. Slide the syringe barrel beneath the barrel clamp (refer to Figure 9). Do not pull forward on the barrel clamp.

Note: Ensure that the graduation lines on the syringe face you.

5. The syringe is properly installed when the syringe flange rests in the slot of the syringe compartment base (refer to Figure 9, inset).
6. Fully squeeze the pusher block lever against the stop. Carefully move the pusher block until it contacts the syringe plunger (refer to Figure 10). Release the pusher block lever to secure the syringe plunger.

Note: Ensure that both plunger retainers capture the syringe plunger (refer to Figure 10).

7. Close the syringe compartment door. Then, lock the syringe compartment door by pressing in and turning the syringe compartment key clockwise.
## Basal + PCA Infusions

### Basal + PCA Programmable Ranges

<table>
<thead>
<tr>

</tr>
<tr>
<td><strong>Loading dose volume range</strong></td>
<td>0.1 mL to 9.9 mL in 0.1 mL increments</td>
</tr>
<tr>
<td><strong>Clinician bolus dose volume range</strong></td>
<td>0.1 mL to 9.9 mL in 0.1 mL increments</td>
</tr>
<tr>
<td><strong>Priming rate</strong></td>
<td>180 mL/hr</td>
</tr>
<tr>
<td><strong>Priming volume</strong></td>
<td>0.5 mL per START button press</td>
</tr>
<tr>
<td><strong>Lockout time range</strong></td>
<td>3 minutes to 240 minutes</td>
</tr>
</tbody>
</table>

**Note:** The lockout time begins when the PCA bolus is completed OR upon resiting if the lockout time has been modified. Lockout timing is not affected by clinician boluses.

| Concentration range        |                                     |
|----------------------------|                                     |
| -                          | 0.1 mg/mL to 99.9 mg/mL in 0.1 mg/mL increments |
| -                          | 1 MCg/mL to 999 MCg/mL in 1 MCg/mL increments |

Programming a Basal + PCA Infusion

Note: When available, press [BACK] during programming to return to the previous screen.

Note: An audible tone confirms each request for a dose.

Note: When the syringe is removed and a new syringe is installed, the pump will go to either the "Confirm Syringe" or "Syringe Selection" screen.

Note: Any calculated values are rounded to the nearest least significant digit of precision. For example, if the precision is 0.1, a calculated value of 25.75 rounds to 25.8. A calculated value of 25.74 rounds to 25.7.

Note: When an infusion is initiated there can be a delay, especially at lower flow rates, before the pressure on the syringe plunger takes on the slack in the system and applies enough pressure to overcome the initial resistance of the plunger in the syringe barrel. Software in the pump has been designed to minimize this delay before solution delivery actually begins.

Note: The pump's post occlusion bolus reduction feature is designed to reduce the amount of medication that could be inadvertently administered to the patient after the removal of an occlusion during infusion. The pump's motor runs backwards slightly after an occlusion is detected to relieve the pressure that builds up in the system. This enables the pump to relieve accumulated pressure caused by an occlusion that would result in a larger-than-intended bolus of medication to be delivered upon removal of the occlusion.

Note: If a patient request is made by pressing the PCA button before the lockout time has elapsed, the attempt is recorded but no injection is given.

Note: The default clinician password for security coding is "1234". However, this password can be customized. Refer to User Identification in "Preferences" for more information.
**Note:** The following is a list of all possible programming screens, not necessarily the order of the screens as shown when programming the pump.

<table>
<thead>
<tr>
<th>The Display Screen Says:</th>
<th>Basal + PCA Infusion Programming Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>WARNING:</strong> Programming the pump and another clinician check the accuracy of prescription and programming information before the infusion is started.</td>
<td></td>
</tr>
</tbody>
</table>
| **Power Up Complete** | Review the date and time information.  
• Press YES if the date/time information is correct.  
• Press NO if the date/time information is incorrect.  
This will advance the pump to the numeric keypad, where the correct date/time information can be entered. |
| **Lock Cover/Unlock Cover** | Follow the screen prompts, which will prompt you to either unlock/lock or lock/unlock the syringe compartment door.  
**Note:** This step verifies that the operator is authorized to use the pump. |
| **Resume Therapy** | If the pump was turned off during an infusion:  
• Press YES to resume the programmed infusion.  
This will take the pump to “Confirm Syringe.”  
**Note:** You have up to one hour after the pump is turned off to resume the infusion.  
• Press NO to cancel the infusion. This will take the pump to “Patient History.” |
| **Patient History** | • Press YES to clear the patient history.  
**Note:** Once YES is pressed, all patient history is deleted. If you wish to upload the patient history to either a printer or PDA, press the HISTORY button.  
• Press NO if you do not want to clear the history. This will return the pump to “Resume Therapy.” |
<p>| <strong>Load Syringe</strong> | Load the syringe. |</p>
<table>
<thead>

Programming a PCA Only Infusion

Note: When available, press BACK during programming to return to the previous screen.

Note: An audible tone confirms each request for a dose.

Note: When the syringe is removed and a new syringe is installed, the pump will go to either the "Confirm Syringe" or "Syringe Selection" screen.

Note: Any calculated values are rounded to the nearest least significant digit of precision. For example, if the precision is 0.1, a calculated value of 25.75 rounds to 25.8. A calculated value of 25.74 rounds to 25.7.

Note: When an infusion is started there can be a delay, especially at low flow rates, before the pressure on the syringe plunger takes up the slack in the system and applies enough pressure to overcome the initial resistance of the plunger in the syringe itself. Software in the pump has been designed to minimize this delay before solution delivery actually begins.

Note: The pump's post occlusion bolus reduction feature is designed to reduce the amount of medication that could be inadvertently administered to the patient after the removal of an occlusion during infusion. The pump's motor runs backwards slightly after an occlusion is detected to relieve the pressure that builds up in the system. This enables the pump to release accumulated pressure caused by an occlusion that would result in a larger-than-intended bolus of medication to be delivered upon removal of the occlusion.

Note: If a patient request is made by pressing the PCA button before the lockout time has elapsed, the attempt is recorded but no injection is given.

Note: The default clinician password for security codes is "123." However, this password can be customized. Refer to User Identification in "References" for more information.
Note: The following is a list of all possible programming screens, not necessarily the order of the screens as shown when programming the pump.

<table>

Programming a Continuous Only Infusion

Note: When available, press BACK during programming to return to the previous screen.

Note: When the syringe is removed and a new syringe is installed, the pump will go to either the "Current Syringe" or "Syringe Selection" screen.

Note: Any calculated values are rounded to the nearest least significant digit of precision. For example, if the precision is 0.1, a calculated value of 25.75 rounds to 25.8. A calculated value of 25.74 rounds to 25.7.

Note: When an infusion is initiated, there can be a delay, especially at low flow rates, before the pressure on the syringe plunger takes up the slack in the system and applies enough pressure to overcome the initial resistance of the plunger in the syringe itself. Software in the pump has been designed to minimize this delay before solution delivery actually begins.

Note: The pump's post-excision bolus induction feature is designed to reduce the amount of medication that could be inadvertently administered to the patient after the removal of an occlusion during infusion. The pump's motor runs backwards slightly after an occlusion is detected to relieve the pressure that builds up in the system. This enables the pump to release accumulated pressure caused by an occlusion that would result in a larger-than-intended bolus of medication to be delivered upon removal of the occlusion.

Note: The default infusion password for security codes is "123." However, this password can be customized. Refer to User Manual in "Preferences" for more information.
Note: The following is a list of all possible programming screens, not necessarily the order of the screens as shown when programming the pump.

<table>

</table>
| “Power Up Complete”      | Review the date and time information.  
  • Press YES if the date/time information is correct.  
  • Press NO if the date/time information is incorrect.  
  This will advance the pump to the numeric keypad, where the correct date/time information can be entered. |
| “Lock Cover/Unlock Cover”| Follow the screen prompts, which will prompt you to either unlock/lock or lock/unlock the syringe compartment door.  
**Note:** This step verifies that the operator is authorized to use the pump. |
| “Resume Therapy”         | If the pump was turned off during an infusion:  
  • Press YES to resume the programmed infusion.  
  This will take the pump to “Confirm Syringe.”  
**Note:** You have up to one hour after the pump is turned off to resume the infusion.  
  • Press NO to cancel the infusion. This will return the pump to “Patient History.” |
| “Patient History”        |  
  • Press YES to clear the patient history.  
**Note:** Once YES is pressed, all patient history is deleted. If you wish to upload the patient history to either a printer or PDA, press the HISTORY button.  
  • Press NO if you do not want to clear the history.  
  This will take the pump to “Resume Therapy.” |
<p>| “Load Syringe”           | Load the syringe. |</p>
<table>
<thead>
<tr>
<th>The Display Screen Says:</th>
<th>Continuous Only Infusion Programming Description</th>
</tr>
</thead>
</table>
| **“Confirm Syringe”**   | • Press YES if the syringe indicated on the screen is the same as the syringe that is loaded. This will take the pump to “Prime Pump (0.5 mL increments).”  
• Press NO if the syringe indicated on the screen is not the same as the syringe that is loaded. This will take the pump to “Syringe Selection.” |
| **“Syringe Selection”** | 1. Press UP or DOWN to scroll to the desired syringe.  
2. Press ENTER to select the syringe and return the pump to “Confirm Syringe.”  
Note: If no syringes is loaded, “Load Syringe” will display. |
| **“Prime Pump (0.5 mL increments)”** | • Press YES if you want to prime the set.  
• Press NO if you do not want to prime the set.  
This will advance the pump to “Mode Selection.” |
| **WARNING** | Make sure the pump is disconnected from the patient infusion site while priming. |
| **“Look Cover to Prime”** | Before priming, close and lock the syringe compartment door. |
| **“Prime Pump (0.5 mL increments)”** | • Press the START button to prime the set (0.5 mL per press).  
• Press the STOP button to stop priming the set. |
| **“Prime Pump (0.5 mL increments)”** | • Press YES if priming is complete.  
• Press NO if you wish to prime an additional 0.5 mL.  
Note: The maximum priming volume per syringe is 5 mL. |
| **“Mode Selection”** | • Press CONTINUOUS ONLY to program a continuous only infusion. |
| **Drug Units Selection”** | Note: This action will not occur if the pump is  
• Percentage to only one unit.  
• Press mL (milliters), mg (milligrams), or MOG (milligrams) to select the desired drug. |
| **“Confirm Drug Units”** | • Press YES if the unit selected is correct and go to “Set Concentration.”  
• Press NO if the unit selected is incorrect. This will return the pump to “Drug Units Selection.” |

Note: If the pump is on manual start, press the START button to begin the infusion. |
| "Bolus Complete"        | Press OKAY to go to "Infusion Stopped." |
Patient History

Transferring Patient History to a Handheld Personal Digital Assistant (PDA) or Printer

In addition to viewing patient history on the display screen, it can be transferred to an optional PDA or IR printer (see Technical Specifications for specific models) without any cables.

To use the PDA or printer: From 3" to 24" away, align the IR port of the device with the IR port of the pump (refer to Figure 11) for approximately three seconds. The transfer takes place after the screen turns off and the devices recognize each other. Then, the screen automatically turns back on.

Note: The devices MUST remain aligned until the transfer of information is complete.

Use this procedure whenever the display screen instructs you to begin printing/uploading.

Figure 11
The default clinician password for security codes is "123". However, this password can be customized. Refer to "User Identifier" in "Preferences" for more information.

The volume reported by the pump may differ from the volume infused into the patient for a variety of reasons, among them: syringe overflow, tight, air purge, and post occlusion flow reduction volumes. The variation in volume may be minimal.

Logged history events are retrievable within 30 seconds of the event. You must exit and return to see events that have just occurred.

The pump will retain the device and event logs, as well as the service and medication history, when the pump is turned off or when the batteries are removed.

Press the HISTORY button to access the patient history menu.
- Use the UP or DOWN key to scroll to the desired selection.
- Press ENTER to select the parameter.
- Press OPTIONS to access the screen that allows you to transfer the information to a PDA or printer. Refer to "Specifications" in the Technical Specifications manual for additional technical requirements.
- If available, press BACK to return to the preceding screen.

Pressing this select to a PDA or printer will include the pump serial number and the date and time the report was requested.

Viewing or printing the complete patient history

To view or print the complete patient history (the initial and current prescriptions, plus all of the information found in the chart history and hourly history screens), do the following:

1. Press the OPTIONS key to transfer the history to the PDA or printer.
2. Press UPLOAD to transfer the information in a PDA or PRINT to transfer the information to the printer.
3. Use the numeric keypad to enter the clinician security code.
4. Use the alphanumeric keypad to enter the patient ID.
5. Align the ports as described in "Transmitting Patient History to a Handheld Personal Digital Assistant (PDA) or Printer.
6. Press the CLR key to send the history to the chosen device.
7. Press CANCEL to return to "Options."

Notes: The event log cannot be uploaded to a PDA.
1. Press PRINT to transfer the information to the printer.
2. Use the numeric keypad to enter the clinician security code.
3. Use the alphanumeric keypad to enter the patient ID.
4. Align H ports as described in “Transferring Patient History to a handheld Personal Digital Assistant (PDA) or Printer.”
5. Press the OK key to send the event log to the printer.
6. Press CANCEL to return to “Options.”
Preferences

Adjusting the Brightness, Contrast, Tone Volume, and Clinician Password

Press the PREFERENCES button to access the pump’s options menu.

Note: The default clinician password for security codes is “123.” However, this password can be customized. Refer to User Identifiers in this chapter for more information.

- Use the UP or DOWN key to scroll to the desired selection.
- Press ENTER to select the parameter.
- If available, press BACK to return to the preceding screen.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| Volume      | The bar graph indicates the relative volume.  
• Press PLUS to increase the volume.  
• Press MINUS to decrease the volume.

| Brightness  | The bar graph indicates the relative brightness of the screen.  
• Press PLUS to increase the brightness.  
• Press MINUS to decrease the brightness.  
• Press ENTER to save the change and return to the main menu. |
| Contrast    | The bar graph indicates the relative contrast of the screen.  
• Press PLUS to increase the contrast.  
• Press MINUS to decrease the contrast.  
• Press ENTER to save the change and return to the main menu. |
| Pump Identifiers | Offers information about the pump, such as the serial number, language, and software/hardware version. |
Note: To change or review the clinician password, insert the syringe compartment key in the lock and unlock the syringe compartment door.

Note: The current clinician password is found at the top of the screen.

1. Use the numeric keypad to enter the new password.
2. Press ENTER.
Alerts and Alarms

Alerts and alarms are listed alphabetically.

Alerts

When an alert occurs:

- An infusion, if initiated, continues.
- An alert tone sounds and the yellow light flashes.
- The display screen tells you the nature of the alert and what you must do.
- Pressing the MUTE button silences the audible alert for approximately 15 minutes.
- Pressing the OKAY key silences the audible alert for approximately 15 minutes and displays a yellow bell at the top of the screen.
- Pressing the yellow bell displays the alert message and restarts the alert tone.
- Clearing the alert condition silences the alert tone and stops the yellow light from flashing.

Note: When an alert occurs while in "Preferences" or "Patient History," press BACK to exit the current screen and view the alert text.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Alarms**

When an alarm occurs:
- The pump stops infusing.
- An alarm tone sounds and the red light flashes.
- The display screen tells you the nature of the alarm and what you must do.
- Pressing the MUTE button silences the audible alarm for two minutes. After two minutes, the alarm tone resumes.
- Clearing the alarm condition silences the alarm tone and stops the red light from flashing.

**Note:** When an alarm occurs while in “Preferences” or “Patient History,” press DA/OK to exit the current screen and view the alarm text.

**Note:** Alarms are disabled under the following conditions:
1. There is no occlusion alarm if the pump is not running.
2. There is no “Cover Unlocked” if the pump is not infusing or priming.

</tbody>
</table>
Service Codes

If a service code occurs, turn off the pump to silence the alarm, then turn on the pump and reprogram the infusion. If the service code occurs again, turn off the pump and contact authorized service personnel.

For additional information about service codes, refer to the Syndeo Maintenance Manual.
Glossary

Alarm
An event marked by a flashing alarm light (red), an alarm tone, and a specific display screen message that signals a condition requiring a response by the operator, that stops the infusion.

Alarm light
A red light located on the front panel. The alarm light flashes whenever the pump is in an alarm state. It is on when the pump is in a service code condition, and during POSTs and certain POST failures.

Alert
An event marked by a flashing alert light (yellow), an alert tone, and a specific display screen message that provides important status information or signals a condition requiring a response by the user. An infusion continues if underway.

Alert light
A yellow light located on the front panel. The alert light flashes whenever the pump is in an alert or notification state. It is on during POSTs, certain POST failures, and when the pump is not infusing or in the service mode.

Attempt
The patient’s press of the PCA button, which is intended to initiate a PCA dose.

Basal + PCA infusion mode
A pump operating mode where the motor runs at a continuous rate and additional drug delivery may be initiated by the patient during the active therapy.

Basal rate
The programmed continuous infusion rate when the pump is operating in basal + PCA mode.

Button
A physical button that is permanently located on the device. Each button performs a dedicated function and is labeled accordingly.
**Chart history**
Displays the number of PCA injections, number of PCA attempts, and amount of medication delivered since the last time chart history was cleared, as well as the actual time the chart history was cleared.

**Clinician password**
A code that must be entered by the user to gain access to the clinician controlled functions.

**Concentration**
Programmed amount of drug in milligrams or micrograms per milliliter of fluid.

**Continuous Only infusion mode**
A pump operating mode where the motor runs at a continuous rate.

**Continuous rate**
Programmed continuous infusion rate when the pump is operating in continuous only mode.

**Display screen**
The information screen on the front of the pump.

**Event log**
Lists the alerts, alarms, infusion start/stop, syringe component lock/ unlock, loading dose start, clinician bolus start, PCA dose start, and prescription changes since the last time the medication history was cleared. Information displayed is in reverse chronological order (the most recent events first).

**Four-hour limit**
The programmed maximum volume of drug that may be delivered during a four-hour period.

**Hourly history**
Displays the infusion amount delivered, number of PCA injections, and number of PCA attempts in hourly segments.
Incompatible syringe

Any syringes other than those listed in “Setting Up the Pump,” Installing the Syringe.

Note: NOTE: Multiple labels applied to the syringe barrel could affect the measured diameter of approved syringes.

Infusion mode

One of the three types of operating modes supported by the pump: Basal + PCA, Continuous Only, or PCA Only.

Light

Colored light indicators on the pump’s front panel.

Loading dose

Optional initial dose delivered at the start of therapy.

MCG

Microgram

mg

Milligram

mL

Milliliter

Notification

A notification informs the operator of a condition that requires a response before further operator navigation is allowed. A notification includes an audible signal.

One-hour limit

The programmed maximum volume of drug that may be delivered during a one-hour period.

Patient history

A collection of data that lists the most recent or current therapy, consisting of the prescription data, alarm status, and infusion totals.

PCA

Patient Controlled Analgesia
PCA button
An external PCA button that connects to the pump via a cord and allows the patient to initiate PCA doses.

PCA dose
The programmed volume of drug to be injected when requested by the patient.

PCA Only infusion mode
A pump operating mode where the motor runs only when a drug is being infused by the patient during the active therapy.

PCA request
PCA action (PCA button press) intended to initiate a PCA dose. The PCA dose request is recorded in the patient history as an attempt. If a PCA dose is delivered (partial or complete) as a result of a request, it is also recorded in the patient history as an injection.

POST
After the pump is turned on it goes through a series of Power On Self Tests (POSTs) to verify the proper operation of the pump.

Service code
An event marked by a problem with the pump that may prevent correct software operation, where the user is not allowed to navigate from the service code screen.

“Sleep”
The pump disables the display screen backlight to save power after one minute of inactivity, rendering the display screen unviewable. A touch of the display screen or any button “wakes up” the screen.

Standby
A state initiated by the user where the pump contains the programmed infusion information in memory for future use. In this state, user input is restricted and the therapy cannot be started until security is passed and the current prescription is confirmed.

Therapy
A course of treatment using a programmed prescription and initiated by a confirmed prescription. During the therapy, a patient may receive one or more bolus doses, one or more PCA doses, and/or a continuous infusion.
